HIGHS

ADVANCED SPORTS NUTRITION

High5's drinks contain

2:1
FRUCTOSE

see note [6]

Have you ever thought
how fast you might ride
and how far you could go

tested 2009 High5's drinks
5 min 45 sec faster!

2:1
FRUCTOSE

26 readers from Cycling Weekly took part in a large study run by Dr. Andy Cathcart from the University of Glasgow. Riders following the **High5 Race Faster Guidelines** and using **High5's 2:1 fructose drinks**, were substantially quicker than when using their regular brand of nutrition used the way they normally use it. The average difference during a **40 mile (64km) Time Trial** was **5 min 45 sec**. A similar test was conducted by the ILUG University in Germany. Riders using High5 over the 40 mile time trial were 8 min 12 sec quicker and produced 15% more power on average.

The Cycling Weekly reader tests were intended to simulate a Cyclo Sportive and longer MTB event. The tests involved 40 or 50 miles (dependent on rider) completed at moderate intensity, followed by a 40 mile (64km) flat out Time Trial. The tests compared High5's 2:1 fructose drinks used as per the High5 race faster guidelines vs riders normal brand of nutrition, which the test subjects were free to consume as they would normally. Full details of the Cycling Weekly and ILUG studies at: www.highfive.co.uk

tested 2009 High5's drinks 10% faster in 8 day Trans Alp Enduro

University of Glasgow Study (2008): riders were shown to be on average 10% quicker (a staggering 4 hours and 25 minutes) over the 8-days of the Trans Alp event using **High5's EnergySource 4:1** drink (with protein), as compared to a standard carbohydrate only sports drink. Race temperatures reached a blistering 38°C in the shade. (*Cathcart et al., Med Sci Sports Exerc; 40 (5) Supplement 1:S74, 2008*).

[4] Some High5 products contain caffeine. EnergySource X'treme may also contain Citrus Aurantium (Synephrine). These substances are in the 2009 WADA monitoring program, but are not considered as prohibited substances. However, there may be special regulations applied by your sporting body and the WADA regulations may be subject to change.

High5 - research proven drinks
that let you ride faster and further

see note [4]

your sports nutrition should provide:

1. carbohydrate This is the fuel that lets you ride both fast and far. 70% of the effort required for a 2:45 to 3:45 marathon is fueled by carbohydrate and not fat. Unfortunately, your body can only store a limited amount of carbohydrate - typically 400g for a 75kg athlete when rested. Race anything over 90 minutes and your carbohydrate store can be depleted.

Any carbohydrate that you are able to consume during a ride (drinks, gels etc) adds to your body's store of carbohydrate. **High5's** new generation of sports drinks with a **2:1 fructose** ratio can provide your working muscles with up to 90 grams of carbohydrate per hour. That's 50% more than the best traditional^[5] sports drinks can provide.

[5] A traditional sports drink refers to a drink formulated with glucose, dextrose, maltodextrin or any other carbohydrate that breaks down to glucose during digestion and before absorption into the blood stream and a drink which contains little or no fructose.

2. fluids For optimum performance, you should aim to replace sweat loss by consuming sports drinks. Racing in the heat, it's hard to drink enough to keep up with sweat loss. In hot conditions, you can sweat more than 1.5 litres per hour, the equivalent of two large drink bottles.

The **2:1 fructose** formulation found in **High5's** drinks has been shown to deliver fluids faster than traditional sports drink formulations. **High5's** drinks also contain a relatively high level of key electrolytes.

3. caffeine in moderate doses can substantially increase the absorption of carbohydrate and fluids. Caffeine also stimulates the body's nervous system: reducing fatigue, making you more alert, increasing your concentration and reducing the feeling of effort during sport. In the right amount (3mg to 6mg caffeine per kg of body weight), caffeine is an effective performance enhancer. A moderate dose of caffeine has not been shown to significantly increase dehydration during sport.

If you are sensitive to caffeine and experience symptoms such as hand tremors, heart palpitations etc., then stop using it immediately. If you have a heart condition do not use caffeine. You can continue to follow these guidelines by switching from products containing caffeine, to the equivalent products with no caffeine.

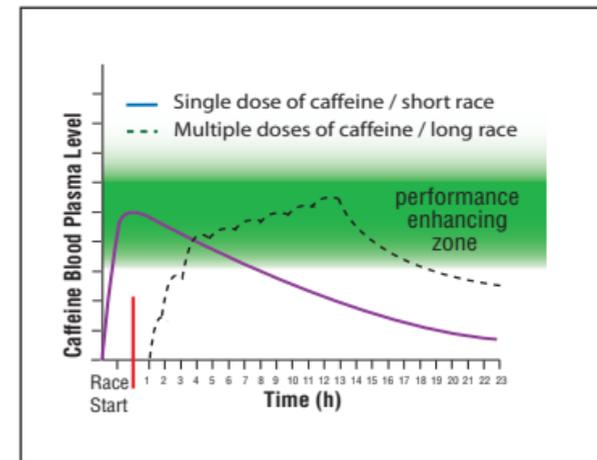

Fig 1. caffeine blood plasma levels over time

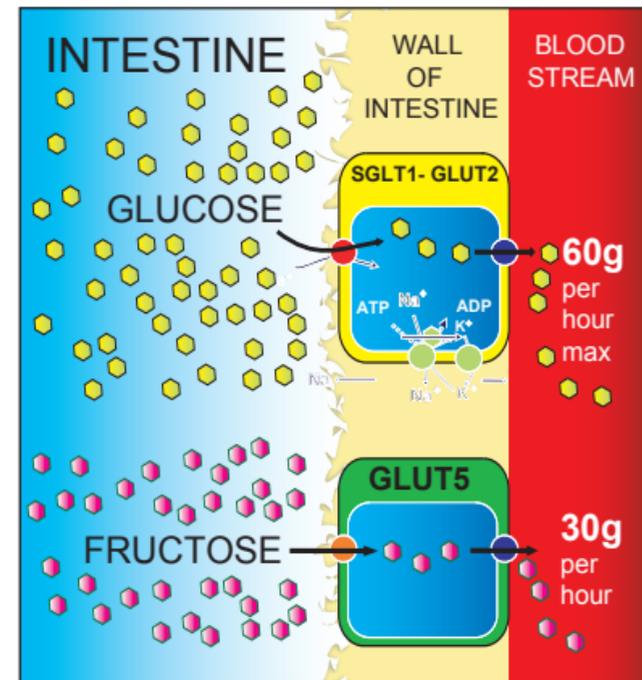

the science behind High5's 2:1 fructose drinks

The different types of carbohydrates used in traditional sports drink formulations are first broken down to glucose by your digestive process.

That *glucose* then passes through the wall of your intestine into your blood stream. To pass through the wall of your intestine, the *glucose* molecules use "revolving doors" known as the *glucose* transporters.

As these revolving doors only allow *glucose* to pass slowly, they limit the amount of carbohydrate your body is able to absorb to **60 grams per hour**. For many years, that was thought to be the upper limit to the amount of carbohydrate you could absorb - but not any more.

High5's drinks with their new **2:1 fructose** formulation can now deliver up to **90 grams** of carbohydrate per hour. Fructose (fruit sugar) is a unique carbohydrate, which is not broken down to *glucose* by digestion. It passes through the wall of the intestine using a different set of doors to *glucose*.

Absorption of combined glucose and fructose

High5's new drinks contain **2 parts maltodextrin** (a traditional type of carbohydrate that breaks down to glucose during digestion) and **1 part fructose**. You can see from the diagram that **90 grams** of this 2:1 combination can be absorbed per hour. As carbohydrate is the fuel for speed and endurance, the more you have available the stronger and further you can ride.

Most traditional sports drinks and gel contain no fructose or relatively low levels. High5's drinks contain around 33% or more fructose.^[6]

NB: The 2:1 fructose formulation simply allows you to absorb more carbohydrate than was previously possible. **To benefit from it you must eat and drink more than you would normally.**

[6] High5's drinks containing approx. 33% or more fructose are: EnergySource, EnergySource 4:1, EnergySource X'treme and Isotonic

ride fast

ride far

finish strong

To ride fast, to ride far
and to finish strong you need to:

- Maximise carbohydrate intake during your ride
- Minimize dehydration
- Load with an exact dose of caffeine

To achieve these three things, you will need a customized strategy for every competition dependent on **your** race distance, the amount **you** are able to drink (race temperature) and **your** body weight. In the following guidelines, the ultimate nutrition strategy for every event has been worked out for **you**.

get to know your best friends...

EnergySource

The main drink for racing and everyday training.

flavours: orange, citrus, summer fruits and tropical ✓ 2:1 fructose ✓ exceptional fluid replacement / high in electrolytes ✓ no stomach problems ✗ no caffeine

EnergySource 4:1

4:1 is standard EnergySource with whey protein isolate added. It's the ultimate drink for training, distance racing, supporting large increases in weekly mileage (eg. a training camp), core strength training and speed work.

flavours: orange and summer fruits ✓ 4:1 whey protein isolate (CFM & lactose free) ✓ 2:1 fructose ✓ no stomach problems ✓ exceptional fluid replacement / high in electrolytes ✗ no caffeine

EnergySource X'treme

X'treme is standard EnergySource with a high level of caffeine (150mg per 500ml). Use to: caffeine load prior to an event, as a pre training get-up-and-go drink, to increase the intensity of power sessions and to recover when you go off-the-back during a longer ride. Use X'treme as directed, you cannot use it as you would a normal sports drink.

flavours: citrus ✓ 2:1 fructose ✓ high electrolyte anti-cramp ✓ no stomach problems ✓ high in caffeine

Protein Recovery

Protein Recovery is designed for total recovery after exercise. Mix with water (fast release) or milk (slow release for overnight feeding). EnergySource 4:1 can be used to effectively recover after exercise, but Protein Recovery is the more complete recovery product.

flavours: banana, chocolate, summer fruits ✓ 21/2:1 ratio of whey protein isolate (CFM) ✓ slow or fast release ✗ no caffeine

choose your gel...

EnergyGel

EnergyGel is a concentrated form of carbohydrate, so it's lighter in weight and easier to carry in larger numbers. EnergyGel does not contain 2:1 fructose as it would be very sweet if it did. To be taken with water.

flavours: orange, banana, summer fruits, apple and citrus ✓ not too thick or sweet ✓ light real juice flavours
✗ not 2:1 fructose ✗ no caffeine.

IsoGel

You do not need to drink additional water with IsoGel. It's lighter, less sweet and easier to swallow than EnergyGel. In the following guide, you can substitute one sachet of IsoGel for one sachet of EnergyGel. IsoGel is, however, more bulky to carry.

flavours: orange and berry ✓ do not need to drink additional water ✓ not thick or sweet ✓ very light real juice flavours
✗ not 2:1 fructose ✗ no caffeine

EnergyGel Plus

EnergyGel Plus is the same as standard EnergyGel but with 30mg of caffeine added per sachet.

flavours: orange plus, raspberry plus ✓ 30mg caffeine per sachet

IsoGel Plus

IsoGel Plus is the same as standard IsoGel, but with added caffeine (30mg per sachet).

flavours: citrus plus ✓ 30mg caffeine per sachet

Goodie Bag & Gel Flask

Goodie bag fits behind the stem and is aerodynamic and secure. Gel flask holds up to 4 EnergyGel sachets and can be used one-handed.

an optimum nutrition
strategy for

down hill
X' country
enduro solo
enduro team relay
enduro multi day events

downhill

90 minutes before - caffeine load:

Drink one 750ml bottle of EnergySource X'treme 90 minutes before your race starts. At the same time take the following EnergyGel Plus sachets based on body weight:

50kg to 60kg: 1 x EnergyGel Plus
60kg to 70kg: 2 x EnergyGel Plus
70kg to 90kg: 3 x EnergyGel Plus

between races:

Take one EnergyGel Plus per hour to keep your caffeine level in the performance enhancing zone.

Sip on EnergySource 4:1 to remain hydrated and fuelled up.

recovery after:

To rehydrate, refuel and drink 500ml to 1000ml of EnergySource 4:1 after you finish.

note: You can substitute IsoGel Plus for EnergyGel Plus.

learn more: www.highfive.co.uk

X'Country 2 to 5 hr events

try in training before you race

60 to 90 minutes before - caffeine load:

Drink one 750ml bottle of EnergySource X'treme in the period 60 to 90 minutes before your event starts. At the same time take the following number of EnergyGel Plus sachets based on body weight:

50kg to 60kg: 1 x EnergyGel Plus
60kg to 70kg: 2 x EnergyGel Plus
70kg to 90kg: 3 x EnergyGel Plus

10 minutes before the start:

Drink 200ml to 500ml EnergySource. This counts towards the drink you have consumed in the first hour.

during your event:

Focus on drinking as much as possible. Your body is able to absorb more than 90g per hour of the 2:1 fructose mix found in EnergySource.

Depending on how much you are able to drink, you may need to take gel to further boost your carbohydrate intake. If you drink the following amounts of EnergySource each hour, also take the number of gels shown:

800ml to 1200ml	no gel
600ml:	1 x EnergyGel Plus
400ml:	2 x Gels
200ml:	3 x Gels

The first gel each hour should be EnergyGel Plus (with caffeine). Any remaining gels taken in that hour should be standard EnergyGel (no caffeine).

recovery after:

To rehydrate and refuel, to help develop lean muscle faster and improve fitness gains: drink 750ml of EnergySource 4:1 when you finish. Drink another 500ml one hour later. Eat a balanced meal. In the late evening drink 750ml or more of Protein Recovery. When mixed with milk, Protein Recovery is absorbed more slowly and provides a long lasting feed while you sleep.

notes: Substitute IsoGel for EnergyGel if you wish. Use a Gel Flask for one-handed operation.

These guidelines should provide your body with the maximum amount of carbohydrate it can absorb. Do not eat or drink anything else. You will not need it. Carbo-loading before an event can increase the amount of carbohydrate you have stored by more than 30%. See back of guide.

If you are competing in very hot conditions, you may require additional electrolytes in your drink together with an anti cramp magnesium formula. See High5's ZERO Salts.

There are alternate High5 strategies that can achieve the same result. Visit web site for details.

learn more: www.highfive.co.uk

enduro 5 to 24 hr - solo

try in training before you race

60 to 90 minutes before - caffeine load:

Drink one 750ml bottle of EnergySource X'treme in the period 60 to 90 minutes before your race starts. At the same time take the following number of EnergyGel Plus sachets based on your body weight:

- 50kg to 60kg: 1 x EnergyGel Plus
- 60kg to 70kg: 2 x EnergyGel Plus
- 70kg to 90kg: 3 x EnergyGel Plus

during your event:

To maximise your carbohydrate intake, you should focus on drinking as much EnergySource 4:1 as possible.

Depending on how much you are able to drink, you may need to take gel to further boost your carbohydrate intake. If you drink the following amounts of EnergySource 4:1 each hour, you should also take the number of gels shown:

800ml to 1200ml	no gel
600ml:	1 x EnergyGel Plus
400ml:	2 x Gels
200ml:	3 x Gels

The first gel each hour should be EnergyGel Plus (with caffeine). Any remaining gels taken in that hour should be standard EnergyGel (no caffeine).

recovery after:

To rehydrate and refuel, to help develop lean muscle faster and to improve fitness gains drink 750ml of EnergySource 4:1 as soon as you finish. Drink another 500ml to 750ml one hour later. Eat a balanced meal. In the late evening drink 750ml or more of Protein Recovery mixed with milk.

notes: Read the notes for 2 to 5 hour X'country events, as these also apply to longer enduro events. In addition note the following points:

If you drink 1000ml per hour and are therefore not taking gel with caffeine during your event, you should aim to

consume 500ml of High5's X'treme once every 3 1/2 hours (heavy weight riders) to 5 hours (lighter riders). This will keep your caffeine levels in the performance enhancing zone.

These guidelines should provide your body with the maximum amount of carbohydrate it can absorb. Try not eat anything else, as normal solid food will slow the absorption of the special High5 carbohydrate. If you do feel the urge to eat solid food, then stick to rapidly absorbed carbohydrate such as white bread (with just a smear of spread to help it slide down), pasta or high carbohydrate energy bars. Try to stay away from meat and high fat items such as chocolate.

learn more: www.highfive.co.uk

Enduro 12 to 24 hr - team **try in training before you race**

If you are racing as part of a relay team in a 12/24 hour race then:

If your (individual) total ride time is going to be less than 5 hours, follow the nutrition guidelines for X'country 2 to 5 hour events.

If your ride time is going to be more than 5 hours, then follow the nutrition guidelines for enduro 5 to 24 hour events.

Also note the following points:

60 to 90 minutes before - caffeine load once only before starting your first relay ride.

Do not caffeine load again with High5's X'treme during the remainder of the race.

between bouts of riding - take one EnergyGel Plus sachet every hour while not riding. As an alternative, drink a cup of tea or 1/2 a cup of coffee (not strong) each hour. This will help keep your caffeine level's in the performance enhancing zone.

eating solid food - As most athletes prefer some form of "solid" food when racing over long periods, the best advice is to snack on a moderate amount of easily digested high carbohydrate foods, while drinking as much EnergySource 4:1 as you can.

Enduro multi day events **try in training before you race**

Research by Glasgow University, showed that riders were (on average) 10% or 4 1/2 hours faster over the 8-days of the Trans Alp using High5's EnergySource 4:1 drink, as compared to a carbohydrate only drink.^[7] Race temperatures reached a blistering 40°C in the shade.

For multi day racing simply follow the guidelines for Enduro 5 to 24 hour events.

If you empty your carbohydrate reserves in one day's riding, it's almost impossible to fully re-fuel by the next day and you

will start with a part-empty tank. You must make a major effort to focus on fuelling your carbohydrate reserves during and after each day's riding. This is critical to consistent performance in multi day events.

racing in very hot conditions:

High5's drinks contain a relatively high level of key electrolytes and for most conditions they are more than adequate. However, in very hot conditions you may want to increase the electrolyte content of your drinks. You can do this using High5's ZERO SALTS - a neutral tasting effervescent tablet with an anti-cramp magnesium formula.

[7] Trans Alp study: Cathcart et al., Med Sci Sports Exerc; 40 (5) Supplement 1:574, 2008.

learn more: www.highfive.co.uk

carbo-loading

Carbo-loading is normally undertaken prior to a major event. It's a technique that can increase your body's carbohydrate stores by 30% or more. Here is an effective and easy method that does not require long periods of non training or a radical change to your diet.

days 3-2-1 before your race: each morning drink 750ml of EnergySource. Wait for 30 minutes, then jump onto your bike and warm up easy for 10 minutes. Follow that warm up with a single 3 minute sprint. You should aim for a good lactic acid build-up during the sprint, which will encourage your body to store carbohydrate.

You should then aim to consume 10 grams of carbohydrate per kg body weight during the day. For a 70kg rider that would be 700 grams of carbohydrate per day.

Athletes often find it difficult to consume that amount of carbohydrate using normal food. To avoid the bulk of high-carb foods: **every three hours** drink 500ml of EnergySource and eat one energy bar. After 12 hours this will provide you with around 360 grams of carbohydrate. Your normal high carbohydrate diet should provide the rest.

4:1 and training

You become fitter and faster as your body changes (adapts) in response to training. For every few hundred miles of riding, you would normally expect to see an increase in muscle quality and fitness. But what if you could build lean muscle faster and get fitter quicker with the same amount of training?

EnergySource 4:1 is better for hard training and racing over multiple days:

Sports scientists from the University of Glasgow in 2008 showed that during the gruelling 8-days of the Trans Alp MTB race, riders using a protein / carb drink (EnergySource 4:1) raced an average ~ 10% faster compared to a carb only drink.^[8]

Protein / carb shown to be better for muscle development:

Researchers from Maastricht University in 2007 showed that compared to a carbohydrate only drink, consuming a protein / carb drink lowered the rate of protein breakdown during hard exercise by 26% and raised protein synthesis (muscle rebuilding) by 33%.

Protein / carb superior for two sessions in one day:

In a 2008 study: when cyclists rode flat-out for one hour and then after a pause of 6 hours they rode again for one hour as fast as possible, they were significantly faster in the second ride after consuming protein/carb as compared to consuming carbohydrate only.

When you find it hard to get motivated: to prepare for a tough session, take X'treme stimulant drink 30 minutes before you start. Take a couple of sachets of X'treme in your back pocket to get you or a friend back home if you bonk.

High5's ZERO is a low calorie effervescent tablet sports drink with electrolytes and magnesium.

High5's ZERO SALTS (neutral flavour) can be added to any drink to make it into a sports drink. It can also be added to High5's sports drinks to increase the electrolyte content if you are racing in very hot conditions.

burn more fat during exercise

High5's GT100 is a new "activated" green tea extract, which is designed to increase fat oxidation (the amount of fat burned) during exercise. Each tube contains 40 days supply - one capsule per day. Available 2010. For info visit: www.highfive.co.uk

Train low race high: This is the concept of training on low carbs / low glycogen in order to improve endurance. Both Zero and GT100 can be used as part of this strategy. For more information visit: www.highfive.co.uk

[8]Trans Alp study: Cathcart et al., Med Sci Sports Exerc; 40 (5) Supplement 1:S74, 2008. J Int Soc Sports Nutr, January 1, 2008.

ride faster & stronger or your money back

High5's drinks with 2:1 fructose are advanced nutrition for anyone who wants to ride faster and stronger. The special carbohydrate mix can provide up to **50% more energy** and deliver fluids faster than traditional sports drink formulations.^[5]

The protein / carb formulation found in **EnergySource 4:1** has been shown to be superior for enduro events, hard training and to help maximize the development of lean muscle.

If you follow the advice in this Race Faster Guide, we are so confident that you will ride substantially faster and stronger over every distance, that **we offer you a full money back guarantee.**^[9]

Race Faster Guides are available for more sports. Download free from www.highfive.co.uk

See note [5] on page 6. [9] Race faster guarantee covers events lasting more than 2 hours and it is limited to 600g / 650g sachet size packs of drinks and gels (the appropriate size for first trial). Value will be calculated at RRP or the amount paid. See web site for more details: www.highfive.co.uk
